

Projektbeskrivelse

TITEL	Development of a prognostic tool for adolescent knee pain.
PATIENTGRUPPE	We aim to recruit 300 children and adolescents who consult their general practitioner because of knee pain.
FORMÅL	To develop a prognostic tool for adolescent knee pain that can be used by general practitioners to predict the prognosis of knee pain in adolescent patients and provide a matched treatment.
STUDIEDESIGN	Prospective study.
EVENTUELLE INTERVENTIONER	Not applicable.
STARTDATO FOR REKRUTTERING	01/07/2019
HVOR DELTAGERNE REKRUTTERES FRA	General practice.
INKLUSIONSKRITERIER	Children and adolescents aged between 8 and 19 years old who consult their general practitioner because of knee pain.
EKSKLUSIONSKRITERIER	<p>Age below 8 years old or over 19 years old.</p> <p>Consultation for musculoskeletal pain only in a body region different from the knee.</p> <p>Pain originated from specific non-musculoskeletal conditions (e.g. cancer, infections).</p> <p>Child is vulnerable (e.g. he/she has experienced a recent trauma and the distress may have an impact on the self-report making it not valid).</p> <p>Inability to take part to the study because of inability to understand the questionnaire (i.e. participants who have issues with Danish language or have learning difficulties).</p>
